

Getting Started with Work Requests

Work Requests

Overview

Overview of Work Requests

- Some ADB operations do not take effect immediately
 - Example creating a new ADB instance, it might take a few minutes for instance to transition from provisioning state to running.
- Launching certain operations now spawns a *work request*
 - activity log that enables you to track each step in operation's progress
 - If an operation fails, this helps you determine which step in process had an error.
- Each operation in series of steps can be monitored

<https://docs.cloud.oracle.com/iaas/Content/Compute/Tasks/viewingworkrequestcompute.htm>

Autonomous Database – Supported Work Requests

- List of Serverless work requests
 - Dedicated has additional requests to cover infrastructure operations
- Work requests are retained for 12 hours
- Typical states displayed in Work Requests are:
 - Accepted
 - In Progress
 - Complete / Failed

	Percentage-Based Progress
Create Backup	Yes
Create Instance	Yes
Scale CPU-Storage	Yes
Restore Database	Yes
Delete Backup	No
Terminate Database	No
Start-Stop Database	No
Update License Type	No
Update ACLs	No

Work Request States

- **ACCEPTED**
 - request is in work request queue to be processed
- **IN_PROGRESS**
 - record exists for specified request, but there is no associated WORK_COMPLETED record
- **SUCCEEDED**
 - record exists for request and associated WORK_COMPLETED record has state SUCCEEDED
- **FAILED**
 - record exists for request and an associated WORK_COMPLETED record has state FAILED
- **CANCELING**
 - The work request is in the process of cancelling.
- **CANCELED**
 - work request has been cancelled

Tracking “Create New Instance” Request

Create Autonomous Database

[Help](#) [Close](#)

Provide basic information for the Autonomous Database

Choose a compartment

r1atpdemo5 (root)

Display name

DB 201909030622

The name must contain only letters and numbers, starting with a letter. Maximum of 14 characters

Choose a workload type

Data Warehouse

Configures the database for a decision support or data warehouse workload, with a bias towards large data scanning operations.

Transaction Processing

Configures the database for a transactional workload, with a bias towards high volume of random data access.

Configure the database

CPU core count
